1. Introduction

This battery system is suitable for home energy storage and small and medium-sized commercial storage battery systems. It use 3.2V 104AH lithium cells to form a 16-string battery module and intelligent BMS to from a lithium battery system. The system supports up to 16 batteries in series. This system is prohibited from mixed connection and use with other batteries of different brands and models.

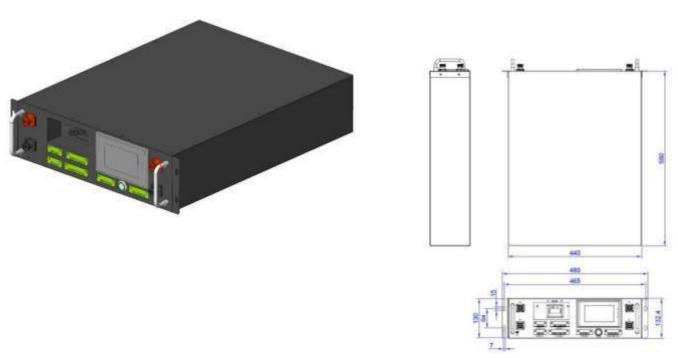

2. Function

- 1) Reliable charge and discharge. Efficient charging and discharging through lithium iron phosphate batteries, long service life and high reliability.
- 2) Automatic protection function.Quick response,high-precision data sampling,and complete and reliable protection function:
- •Overall battery pack over voltage and under voltage protection, single battery cell over voltage and under voltage protection;
- Charge and discharge over current protection;
- Charge and discharge over temperature protection;
- Short-circuit protection;
- 3) Protection reset mode. When the battery pack or cell is under overcharge protection, the voltage returns to the overcharge reset voltage value, and the over current or over discharge protection is automatically rest.
- 4) Battery balancing function.Balance control is performed based on the voltage of each cell,passive discharge balancing method.
- 5) Run historical event storage function.
- 6) The upper computer software control function allows you to protect parameters such as overcharge, over discharge, charge and discharge over current, over temperature and under temperature. Setting parameters such as capacity, sleep, balance and storage.
- 7) RS485 ,RS232 communication function with screen monitoring display.
- 8) CAN communication function, adopts isolated communication and support automatic address encoding or address dialing function.

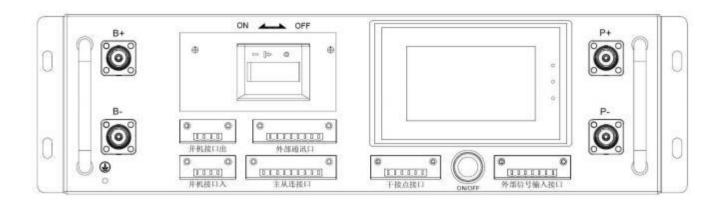

3. Product detail information

3.1 High voltage box module

		Cut-off current	<1A	Configurable	update SOC to 100%

3.5 CAN Communication

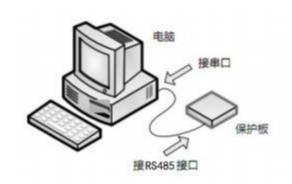

CAN communication protocol compatible with the following brands:

SOFAR	Goodwe	GROWATT	DEYE	Afore
SUFAR 首航新能源	GOODWE	GROWATT	Deye 德業	Aforet

3.6 RS485 communication

BMS can communication with the upper computer through the RS485 interface ,there by viewing Various battery information on the host computer,including battery voltage,current,temperature, status,SOC,SOH and battery production information,etc.

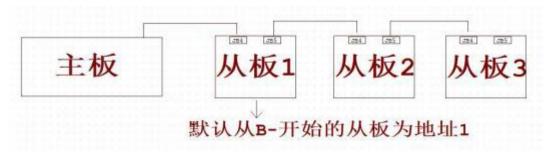

The default baud rate is 57600bps;

3.7 Automatically coding

When the battery modules are connected in series and the slave boards on each module perform cascade communication; or when the battery packs are connected in parallel and the main board performs parallel communications, the system will automatically encode.

The coding between slave boards can also be configured through software, and the coding will be automatically performed according to the wiring sequence. The direction of the superior connection to the main board will automatically determine the sequence. The instructions are as follows:

4 Working mode

4.1 Charging mode

BMS start charging when it detects that the charger is connected and the external charging voltage is greater than the internal battery voltage by more than 0.5V. When the charging current reaches the effective charging current, it enter the charging mode.

4.2 Discharge mode

The BMS enters the discharge mode when it detects that the load is connected and the discharge current reaches the effective discharge current.

4.3 Standby mode

When the above two modes are not satisfied, it enters standby mode.

4.4 Turn off and wake up

4.4.1 Turn off

When any of the following conditions is met, the system enters shutdown mode(it can only be shutdown when there is no external):

- 1) Single or overall over-discharge protection has not been released within 30 seconds.
- 2) Shut down after long pressing the button(3S).

Before entering hibernation, make sure that no charger is connected, otherwise it will not be able to enter low power mode.

4.4.2 Wake up

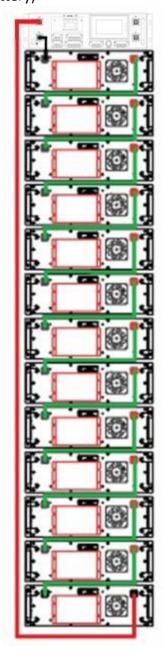

When the system is in shutdown mode and any of the following conditions are met, the system will exit shutdown mode and enter normal operating mode:

- 1) Connect to the charger, the charger output voltage must be greater than 300V.
- 2) Restart the system via the start button(3S).

5 SYSTEM WIRING

5.1 Main circuit wiring

Connect the positive and negative poles of the battery box and main control box as shown in the figure (do not reverse the positive and negative poles, as it will cause a short circuit of the battery, burn the plug-in and damage the battery)

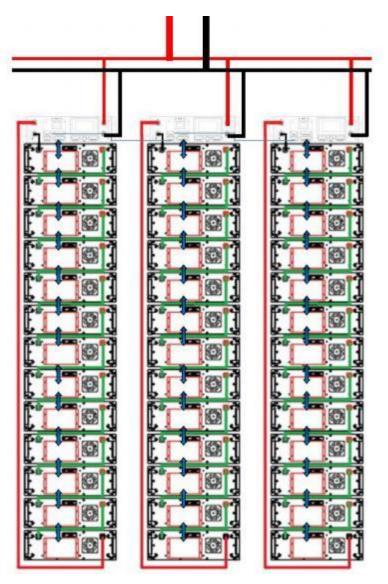

5.2 Communication wiring

The total negative BMU of the battery box is connected to the communication port of the main control box. The communication line is connected in sequence from the total negative BMU of the battery box to the total positive BMU of the battery box.

5.3 Power-on

After using a voltmeter to check that the total battery voltage is normal, check again whether the main circuit wiring and communication wiring are correct. After confirming that they are correct, close the circuit breaker to the ON position and turn on the weak current switch of the main control box. Wait for about a minute. After checking that the display data is normal and there is no error message, the system connection is correct and the system can be powered on and loaded normally.

5.4 Parallel expansion

7.Package

Packed in a dry, dust proof and moisture-proof packing box.

HV-50 Battery system: L 1.1m*W0.9m*H 2.2m Weight: 950kg HV-25 Battery system: L 1.1m*W0.9m*H 1.5m Weight: 720kg

8. Safety precaution

- Don't use the pack if there's any deformation.
- Do not stack up the battery.
- Please be notice the polarity of the battery and port.
- Make sure the insulation of the equipment, use the tool and instrument correctly.
- The installation site should stay away from fire and inflammable, keep ventilating and dry.
- Do not disconnect the battery terminals when its running.
- Not allow non-technology staff to open all of function module.
- Please fully charge a new battery pack,or a long-time-no-use battery pack with a designed charger.
- Do not uninstall,open,extrude,bend,impale or break the battery.
- Do not refit the battery or connect to other object, do not immerse the battery into any water, sea water, or drinks and other liquids. Stay away from fire, explosive material or other dangerous item.
- Do not allow the battery short circuit, do not any metal or conductor contact the terminal.
- Do not let the battery fall. If does, especially on the solid surface, please contact the service center.
- If there is any signs of Electrolyte leakage, do not let it get any direct contact with your bare skin or eyes. If it happened, use plenty of water to clean up or ask doctor for help.
- Do not uninstall the battery cell,or there will cause internal short even fire disaster or other issue.
- Do not burn the battery or throw it to the fire,otherwise,there will be cause the fire of the battery.
